

Ultramol® micro Rexene® FeXQ58

Related Crops

- Ultramol® micro Rexene® FeXQ58 is a stable, water-soluble and non-dusting iron source chelated by HBED and EDDHA.
- The HBED and EDDHA chelation protects the Fe from fixation in the soil, making it available for the plant. This is especially important in alkaline and calcareous conditions where correction or prevention of iron deficiency is needed to optimize plant yield and quality.
- The high quality chelates make FeXQ58 a good choice to extend iron availability for a wide range of vegetables, flowers and tree crops.
- Typical Fe content of 6,0%, of which 4,0% as Fe-HBED ortho-ortho isomer, and 1,8% as Fe-EDDHA ortho-ortho isomer.
- Stable within pH 3,5-12.
- Solubility in water 75 g/l (for practical use).
